Kernel Methods in Machine Learning - Course Notes

Hugo Cisneros

1 Kernels and RKHS

1.1 Positive Definite Kernels

Definition 1

A kernel K is a comparison function $K : \mathcal{X} \times \mathcal{X} \to \mathbb{R}$.
With n data point $\{x_1, x_2, ..., x_n\}$ a $n \times n$ matrix $\mathbf{K}$ can be defined by $\mathbf{K}_{ij} = K(x_i, x_j)$.
A kernel K is **positive definite** (p.d.) if it is **symmetric** ($K(x, x') = K(x', x)$) and for all sets of a and x

$$\boxed{\sum_i \sum_j a_i a_j K(x_i, x_j) \geq 0}$$

This is equivalent to the kernel matrix being **positive semi-definite**.

Examples:

- Kernel on $\mathbb{R} \times \mathbb{R}$ defined by $K(x, x') = xx'$ is p.d. ($xx' = x'x$ and $\sum_i \sum_j a_i a_j K(x_i, x_j) = (\sum_i a_i x_i)^2 \geq 0$).
- Linear kernel ($K(x, x') = \langle x, x' \rangle_{\mathbb{R}^d}$) is p.d
- More generally for any set $\mathcal{X}$, and function $\Phi : \mathcal{X} \to \mathbb{R}^d$, the kernel defined by $K(x, x') = \langle \Phi(x), \Phi(x') \rangle_{\mathbb{R}^d}$ is p.d.

Theorem 1: Aronszajn, 1950

K is a p.d. kernel on the set $\mathcal{X}$ if and only if there exists a **Hilbert space** $\mathcal{H}$ **and a mapping** $\Phi : \mathcal{X} \to \mathcal{H}$ such that, for any x, x' in $\mathcal{X}$:

$$\boxed{K(x, x') = \langle \Phi(x), \Phi(x') \rangle_{\mathcal{H}}}$$

Proof.

(A Hilbert space is a vector space with an inner product and complete for the corresponding norm).

1.2 Reproducing Kernel Hilbert Spaces (RKHS)

Let $\mathcal{X}$ be a set and $\mathcal{H} \subset \mathbb{R}^{\mathcal{X}}$ a class of functions forming a Hilbert space.

Definition 2: Reproducing kernel

A kernel K is called a **reproducing kernel** (r.k.) of $\mathcal{H}$ if

- $\mathcal{H}$ contains all functions of the form

$$\boxed{\forall x \in \mathcal{X}, K_x : t \to K(x,t)}$$

- For every $x \in \mathcal{X}$ and $f \in \mathcal{H}$, $\boxed{f(x) = \langle f, K_x \rangle_{\mathcal{H}}}$

If there exists a r.k., $\mathcal{H}$ is called a RKHS.

Theorem 2: Equivalent Definition of RKHS

$\mathcal{H}$ is a RKHS if and only if for any $x \in \mathcal{X}$, the mapping

$$\begin{aligned} F : &\mathcal{H} \to \mathbb{R} \\ &f \mapsto f(x) \end{aligned}$$

is **continuous**.

Proof.

As a corollary, convergence in a RKHS implies point-wise convergence.

Theorem 3: Uniqueness of RKHS

If $\mathcal{H}$ is a RKHS, it has a **unique r.k.**, and a function K can be **the r.k of at most one RKHS**.

Proof.

Theorem 4

A function $K : \mathcal{X} \times \mathcal{X} \to \mathbb{R}$ is **p.d. if and only if it is a r.k.**.

Proof.

1.3 Examples

1.3.1 Linear Kernel

Definition 3

In $\mathbb{R}^d$, the linear kernel is defined by $K(x,y) = \langle x, y \rangle_{\mathbb{R}^d}$

Theorem 5

2 Kernel tricks

3 Kernel Methods: Supervised Learning

4 Kernel Methods: Unsupervised Learning

5 The Kernel Jungle

5.1 Green, Mercer, Herglotz, Bochner and friends

5.1.1 Green Kernel

Theorem 6: Green Kernel in dimension 1

The set defined by

$$\mathcal{H} = \left\{ f : [0,1] \to \mathbb{R}, \text{absolutely continuous}, f' \in L^2([0,1]), f(0) = 0 \right\}$$

endowed with the inner product $\forall (f,g) \in \mathcal{F}^2 \langle f, g \rangle = \int_0^1 f'(u) g'(u) du$, is a RKHS with with r.k.

$$\forall (x,y) \in [0,1]^2, K(x,y) = \min(x,y)$$

.

Theorem 7: General Green Kernel

If D is a differential operator on a class of functions of $\mathcal{H}$ such that the inner product $\langle f, g \rangle_{\mathcal{H}} = \langle Df, Dg \rangle_{L^2(\mathcal{X})}$
Then $\mathcal{H}$ is a RKHS and admits for r.k. the Green function of the operator D^*D

5.1.2 Mercer Kernels

Definition 4: Mercer Kernels

A kernel K on a set $\mathcal{X}$ is called a Mercer kernel if:

- $\mathcal{X}$ is a compact metric space (typically, a closed bounded subset of $\mathbb{R}^d$)
- $K : \mathcal{X} \times \mathcal{X} \to \mathbb{R}$ is a continuous p.d kernel (w.r.t the Borel topology)

6 Open Problems and Research Topics

A Proofs

A.1 Kernels and RKHS

Proof 1: of Theorem 2

($\Rightarrow$) If a r.k. exists in $\mathcal{H}$ then for any $(x, f) \in \mathcal{X} \times \mathcal{H}$:

$$\begin{aligned} |f(x)| &= |\langle f, K_x \rangle_{\mathcal{H}}| \\ &\leq \|f\|_{\mathcal{H}} \cdot \|K_x\|_{\mathcal{H}} && \text{(Cauchy-Schwarz)} \\ &\leq \|f\|_{\mathcal{H}} \cdot K(x,x)^{\frac{1}{2}} \end{aligned}$$

Therefore, $f \in \mathcal{H} \to f(x) \in \mathbb{R}$ is a linear continuous mapping because F is linear and $\lim_{f \to 0} F(f) = 0$

($\Leftarrow$) F is continuous, by the Riesz representation theorem: there exists a unique $g_x \in \mathcal{H}$ such that $f(x) = \langle f, g_x \rangle_{\mathcal{H}}$.
The function $K : (x, y) \mapsto g_x(y)$ is then a r.k. for $\mathcal{H}$

Proof 2: of Theorem 3

(Uniqueness) If K and K' are two r.k. of a RKHS, then for any x

$$\|K_x - K'_x\|^2 = K_x(x) - K'_x(x) - K_x(x) + K'_x(x) = 0$$

So $K_x = K'_X$

Proof 3: of Theorem 4

($\Leftarrow$) A r.k. is symmetric, and $\sum_{i,j} a_i a_j K(x_i, x_j) = \|\sum_i a_i K_{x_i}\|^2_{\mathcal{H}} \geq 0$

($\Rightarrow$) Let $\mathcal{H}_0$ be the subspace spanned by the functions $(K_x)_{x \in \mathcal{X}}$. If $f = \sum_i a_i K_{x_i}$ and $g = \sum_j b_j K_{y_j}$. Let (not an inner product yet)

$$\begin{aligned} \langle f, g \rangle_{\mathcal{H}_0} &= \sum_{i,j} a_i b_j K(x_i, y_j) \\ &= \sum_i a_i g(x_i) \\ &= \sum_j b_j f(y_j) \end{aligned}$$

($\langle f, g \rangle_{\mathcal{H}_0}$ does not depend on the expansion of f or g) For any $x \in \mathcal{X}$ and $f \in \mathcal{H}_0$, $\langle f, K_x \rangle_{\mathcal{H}_0} = f(x)$.

$$\|f\|^2_{\mathcal{H}_0} = \sum_{i,j} a_i a_j K(x_i, x_j) \geq 0$$

And since Cauchy-Schwarz is valid,

$$|f(x)| = |\langle f, K_x \rangle_{\mathcal{H}_0}| \leq \|f\|_{\mathcal{H}_0} \cdot K(x,x)^{\frac{1}{2}}$$

Therefore $\|f\|_{\mathcal{H}_0} = 0 \implies f = 0$. $\langle .,. \rangle$ is an inner product on $\mathcal{H}_0$.

For a Cauchy sequence $(f_n)_{n\geq 0}$,

$$|f_m(x) - f_n(x)| \leq \|f_m - f_n\|_{\mathcal{H}_0} \cdot K(x,x)^{\frac{1}{2}}$$

For any x the sequence $(f_n(x))$ is Cauchy in $\mathbb{R}$ and therefore converges.
If the functions defined as the point-wise limits of Cauchy sequences are added $\mathcal{H}_0$, it becomes a Hilbert space with K as r.k..

Proof 4: of Aronszajn's theorem

If K is p.d. over a set $\mathcal{X}$, it is the r.k. of a Hilbert space $\mathcal{H}$. The mapping Φ is defined by $\forall x \in \mathcal{X}, \quad \Phi(x) = K_x$.
By the reproducing property

$$\forall (x,y) \in \mathcal{X}^2, \quad \langle \Phi(x), \Phi(y) \rangle_{\mathcal{X}} = \langle K_x, K_y \rangle_{\mathcal{X}} = K(x,y)$$

A.2 The Kernel Jungle
